identify active services and potential weaknesses. An exposed FTP service with anonymous login access provides a critical entry point, enabling the retrieval of backup files containing hashed credentials. By leveraging John the Ripper for password cracking and SSH for authenticated access, further exploration becomes possible. The process concludes with privilege escalation via misconfigured sudo permissions, highlighting typical vulnerabilities commonly found in mismanaged systems.

Methodology:

-> Initially, network-scanning tools like Nmap are used to analyze the environment. This helps identify the devices connected to the network, the services running on them, and any open ports that could potentially be targeted.

```
Currently scanning: 192.168.0.0/16   |   Screen View: Unique Hosts

4 Captured ARP Req/Rep packets, from 3 hosts.   Total size: 240
 IP            At MAC Address     Count     Len  MAC Vendor / Hostname
192.168.56.100  08:00:27:b2:66:07      2     120  PCS Systemtechnik GmbH
192.168.56.1    0a:00:27:00:00:09      1      60  Unknown vendor
192.168.56.112  08:00:27:7b:80:8f      1      60  PCS Systemtechnik GmbH
```

-> An Nmap scan is performed to identify open ports and gather detailed information about the services running on those ports. This helps in understanding the attack surface and determining potential entry points for further analysis.

Command: nmap -A 192.168.56.112

```
Currently scanning: 192.168.0.0/16   |   Screen View: Unique Hosts

0 Captured ARP Req/Rep packets, from 0 hosts.
  Total size: 0
                                          from 0 hosts.
   IP            At MAC Address     Count
Len  MAC Vendor / Hostname
```
